1	Introduction	1
1.1	Motivation and Problem Statement	2
1.2	Contribution	5
1.3	Structure of the Thesis	8
2	Multilevel Systems Modeling	9
2.1	Systems, Complexity and Multiple Levels	9
2.1.1	Emergence of Complex Systems Behavior	9
2.1.2	Structural Organization	11
2.1.3	Inter-Level Causalities	16
2.2	Multilevel Modeling – Brief Overview of Related Terms and Concepts	18
2.2.1	Modeling and Simulation	18
2.2.2	Multilevel vs. Multiscale	19
2.2.3	Hierarchical Model Structures	21
2.2.4	Multiple Abstraction Levels	23
2.3	Why Systems Biology Calls for Multilevel Modeling	27
2.3.1	Organization of Biological Systems	27
2.3.2	Availability of Heterogenous Data	32
2.3.3	Complexity and Accessibility of Models	34
3	Recurring Example Model	41
3.1	Inter- and Intracellular Processes	42
3.1.1	Cell-Cell Communication via Notch Signaling	42
3.1.2	Compartmentalized Subcellular Dynamics	42
3.1.3	Biochemical Processes	44

3.2	Cellular and Cell Population Dynamics	48
3.2.1	Cell Proliferation	48
3.2.2	Spatial Relationships	49
3.3	Linking Cellular and Subcellular Processes	50
3.3.1	Upward Causation	50
3.3.2	Downward Causation	51
3.4	Summary of Multilevel Aspects	52
4	Flat Model, Multiple Levels?	55
4.1	Classical Approaches	55
4.1.1	Differential Equations	55
4.1.2	Petri Nets	61
4.1.3	π -Calculus	67
4.2	Attributed Languages	72
4.2.1	Colored Petri Nets	73
4.2.2	Attributed π -Calculus	76
4.2.3	Rule-based Approaches	81
4.3	Concluding Remarks	86
5	Hierarchically Structured Models	91
5.1	Hierarchical Extensions of Flat Formalisms	91
5.1.1	Hierarchical Petri Nets	91
5.1.2	BioAmbients	95
5.1.3	Compartmental BNGL	98
5.2	Inherently Hierarchical Approaches	101
5.2.1	Statecharts	101
5.2.2	Discrete Event System Specification	106
5.2.3	Bigraphical Reactive Systems	113
5.3	Concluding Remarks	117
6	A Language Concept for Accessible Multilevel Modeling	121
6.1	Requirements	121
6.1.1	General Modeling Paradigm	121
6.1.2	Model Structure	124
6.1.3	Other Expressiveness Requirements	125

6.1.4	Succinctness and Compositionality	126
6.2	Concept	128
6.2.1	General Semantics	128
6.2.2	Rule-based Modeling Approach	129
6.2.3	Multisets of Attributed Entities	132
6.2.4	Rule Schema Instantiation and Pattern Matching	133
6.2.5	Species Bonding	136
6.2.6	Kinetic Rates and Dynamic Constraints	137
6.2.7	Nested Species Multisets	139
6.2.8	Multilevel Rule Schemata	142
6.3	Realization	146
6.3.1	Concrete Syntax of Model Specification	148
6.3.2	Simulation Algorithm	152
7	Syntactic Sugar and Meaningful Extensions	157
7.1	Graphical Syntax	157
7.1.1	Background	157
7.1.2	A Graphical Notation for ML-Rules	158
7.2	Names and Unspecified Attribute Sets	161
7.2.1	Attribute Names	161
7.2.2	Don't Care, Don't Write	162
7.2.3	Transformation to Basic Syntax	163
7.3	Generic Species	167
7.4	Functions on Solutions	170
7.4.1	Problem Statement	170
7.4.2	Counting Function	172
7.4.3	Splitting of Solutions	174
8	Case Studies	177
8.1	Notch Signaling Example	177
8.1.1	General Structure of the Model	177
8.1.2	Biochemical Processes	179
8.1.3	High-Level Processes	183
8.2	Fission Yeast Cell Proliferation Model	189

8.2.1	Main Properties and Structure of the Model	189
8.2.2	Downward Causation in Cell Cycle Regulation	189
8.2.3	Controlling Cell Proliferation via Bidirectional Interlevel Causation	195
8.2.4	Cell Division and Mating Type Switching	199
8.2.5	Intercellular Communication Through Pheromones . . .	202
8.2.6	Spatial Layer	207
9	Conclusion	213
A	Concrete Syntax of ML-Rules	219
A.1	EBNF Grammar (W3C notation)	219
B	Yeast Cell Proliferation Models Encoded in the Concrete Textual Syntax	223
B.1	Cell Cycle Control by Both Downward and Upward Causation .	223
B.2	Multicellular Proliferation and Mating Type Switching	224
B.3	Pheromone-dependent Cell Cycle Dynamics in a Single Cell . .	225
B.4	Multicellular Model of Yeast Cell Proliferation and Intercellular Communication	226
B.5	Proliferating and Communicating Cells in Space	227
