Contents

1 Introduction **1**
- 1.1 Teleoperation . . . 1
  - 1.1.1 Definition . . . 1
  - 1.1.2 History . . . 3
  - 1.1.3 Application . . . 4
- 1.2 Unmanned Aerial Vehicles (UAVs) . . . 5
- 1.3 Motion feedback . . . 9
- 1.4 Thesis outline . . . 12

2 Motion feedback improves performance in teleoperating UAVs **15**
- 2.1 Can motion feedback improve teleoperation performance? . . . 15
- 2.2 The CyberMotion Simulator . . . 16
- 2.3 Virtual environment . . . 19
- 2.4 Disturbance signal . . . 20
- 2.5 Control inputs . . . 20
- 2.6 Experiment description . . . 21
- 2.7 Results . . . 26
- 2.8 Implication of motion feedback on hover performance 29

3 Effects of vehicle- and task-related motion feedback on operator performance in teleoperation **33**
- 3.1 Can spatial decoupling be utilized to improve performance? . . . 33
- 3.2 Operator control station . . . 35
- 3.3 Virtual environment . . . 37
- 3.4 Motion feedback . . . 37

3.5 Disturbance signal 39
3.6 Experiment description 41
3.7 Results 43
3.8 Applicability of tasks describing motion feedback . . 46

4 Novel approach for calculating motion feedback in teleoperation 49
4.1 Can motion feedback be shaped to benefit teleoperation? 49
4.2 Definition of motion feedback in teleoperation 51
4.3 Control Station 54
4.4 Octorotor and remote environment 56
4.5 Video system 57
4.6 Experiment description 58
4.7 Results 60
4.8 Formal motion feedback definition and a real-world application 62

5 Collision avoidance with motion feedback in teleoperation 65
5.1 How does motion feedback relate to collision avoidance? 65
5.2 The teleoperation setup 69
5.3 Feedback calculation 73
5.4 Experiment description 75
5.5 Results 82
5.6 Task-related feedback in teleoperation collision avoidance 85

6 Discussion 91

7 Conclusions 99
